Samsung my files network storage manager

As of today, if you are a Samsung Galaxy user, you may get a new update to the My Files app. This new update provides support for accessing network storage with ease directly in the application. This feature is quite convenient, especially for those who have their own network storage at home and want to access it over the phone without additional application. The process is too simple. First of all, update the app from the Galaxy Store. Then head to My Files and tap Network storage. Now On the next screen, tap Add network storage. I've already added one! Now select either of the two given options, FTP or SMB. For the moment, I will use SMB for my home server (sorta). Add your IP address, port number, user name, and password to the server. The port number for SMB is usually 445. If you doubled in adding credentials and intial setup then congratulations! You can now access your home server on your phone using Samsung My Files. PS: Upload downloads may be limited to the smartphone as well as to the WiFi group that uses your smartphone. For example, here my A6 Plus uses a 2.4GHz band, so the server upload speed is limited to about 3MB / s, which for some reason fluctuated. Verstuurd vanaf mijn SM-T865 met Tapatalk Hello I'm looking for a while why I now can not access Network Storage Manager on samsung My files. On my Galaxy S20 I have the option, but on my Tab S6 I completely miss it and can not even update it. (tells me I have the latest version ...) Does anyone know how I can access it? Thanks good find! It is available now on both the Tab S6 and galaxy S10 Plus. I have the same problem. I have the same last one but there is no choice for network storage to select. When you check what version is installed it displays Ver: 11.5.02.391 but does not show the network storage manager version 11.5.00.331 I see on my other Samsung devices that have network selection. I would like to and reinstall Samsung My Files to see if i can solve, but my Tab A7 will not give me the opportunity to do this. Is there a way to get this feature enabled? Modern smartphones, which have computing power on desktops since the mid-2000s, are much more than phones. Along with their younger siblings – tablets – they essentially became PCs to the point of old-fashioned desktops and laptops were never even close. Did you know that the presentation of a modern smartphone (e.g. Motorola Droid) is 15 times more than the iconic Cray 1 supercomputer of the early 1980s?
